

APT 4900 A & B

FALL 2025 Project Demonstration

Dr. Stanley Githinji

NB: Those working in group project, each student should submit their own project demonstration

Part 1: How to Access Google Vids

1. Open Google.com

Go to your browser and type:

→ <https://www.google.com>

2. Click the Google Apps Icon

At the top-right corner, click the **9 dots (Google Apps)**.

3. Look for the app named “Vids”

Scroll through the list of Google apps.

You should see an icon labeled **“Vids”** (it looks like a small film-strip icon).

4. Click Vids

This will open the Google Vids workspace where you can:

- Create videos
- Record voice
- Add text and scenes
- Import slides
- Generate scripts

Part 2: 10-Minute Project Demo Structure (Google Video + Screen Share)

Sections:

1. Introduction (1 min)
2. Overall Objective (1 min)
3. Key Functionalities (1 min)
4. System Architecture (1 min)
5. Live Demonstration / Walkthrough (4-5 mins)
6. Conclusion (1 min)

1. Introduction

On camera:

- Introduce yourself (name, program, project title).
- Briefly state what problem your project solves and SDG goal/s

Example:

“Hello. My name is ____, and this is my project titled **Mitigating Login Access Compromise in Nigerian Mobile Banking Applications**. My supervisor was Prof. Stanley Githinji. This system was developed to address growing authentication vulnerabilities and help users enhance their login security.”

2. Overall Objective

Screen share title slide / objective slide:

- Explain the main goal of the project in simple terms.

Example:

“The overall objective of this project is to identify authentication weaknesses in mobile banking systems and demonstrate a user-centred solution that improves login protection through secure authentication mechanisms, awareness prompts, and real-time risk detection.”

3. Key Functionalities

Still on screen share:

Introduce the main features one by one. Keep it short and high-level.

Example:

“The system has four main functionalities:

1. **Secure Login Module** – Enforces strong passwords, biometric option, and adaptive authentication.
2. **Suspicious Login Detection** – Flags abnormal login behaviours and triggers warnings.
3. **User Awareness Prompts** – Provides security tips during login to reduce user mistakes.
4. **Audit & Activity Log** – Records login attempts, device info, and risk level for analysis.”

4. System Architecture

Screen share architecture diagram:

Explain the architecture from left to right:

- User Device
- Authentication Module
- Risk Engine
- Database / Logs
- Security Alerts/Prompts

Example:

“The system follows a layered architecture. On the user side, login requests are sent to the Authentication Module, which handles passwords, biometrics, and OTP validation. This feeds into the Risk Assessment Engine, which evaluates device details, login patterns, and potential threats. Approved requests are stored in the Database, while suspicious ones generate alerts and trigger the User Awareness Module.”

5. Live Demo of Key Functionalities

Share your screen showing the actual system.

Demonstration steps:

1. **Open Login Page**
 - ✚ Show how the secure password checks work.
 - ✚ Show biometric toggle or MFA/OTP feature.
2. **Demonstrate Suspicious Login Scenario**
 - ✚ Attempt login with incorrect credentials or unusual pattern.
 - ✚ Show how the system displays warnings.
3. **User Awareness Pop-Ups**
 - ✚ Trigger a security tip (e.g., phishing warning, strong password reminder).
4. **Show the Audit Log**
 - ✚ Navigate to the logs page.
 - ✚ Explain the recorded details: timestamp, device, risk score, status.
5. **If applicable:** Briefly show dashboard or admin view.

Tip: Keep each step short—examiners want clarity, not long actions.

6. Conclusion

Return to camera.

Summarize impact, contribution, and next steps.

Example:

“That is the end of my project, in summary this project demonstrates a practical approach to reducing login compromise in Kenya mobile banking systems by combining technical authentication controls and user-centred security features. The system provides stronger login protection, early detection of risky behaviour, and educates users at the point of authentication. Future improvements may include full integration with mobile platforms and machine-learning-based anomaly detection.”

Part 3: Editing and Submit your presentation

1. Open your video project

- Go to **Google Vids**
- Click the video you created

2. Click the “Share” button

Option A: Share via link

1. Click **Copy link**
2. Choose permission:
Commenter – they can add comments
3. Generate QR code for the video link
4. Send the link through the form <https://forms.gle/5vJ2JcxNKippudzK9>
